

Take note!

Through their ability to aggressively promote fire, these two African grasses are poised to destroy the Sonoran Desert

buffelgrass (*Pennisetum ciliare*)

fountain grass (*Pennisetum setaceum*)

*The First Line of
Defense Begins in
Your Neighborhood!*

Invaders

Two introduced African grasses, buffelgrass and fountain grass, are invading your neighborhood, increasing fire danger around homes and along roadsides. Everyday vehicular traffic spreads their seed into and out of your neighborhood, throughout the city and into natural desert areas. Our desert vegetation evolved without fire, so undeterred spread of these grasses and associated fires will compromise our unique Tucson landscape. Can you imagine Tucson with frequent grass fires and fast-dwindling numbers of saguaros and paloverdes? To protect your own neighborhood and the desert that we live in, we urge you to act now! Eradication of these grasses won't be easy. Buffelgrass is being planted in Sonora and Texas for cattle forage and fountain grass is widely planted as an ornamental grass.

Buffelgrass distribution on roadways in the Tucson metro area.

Buffelgrass infestation in the Pan Quemado Mountains, Ironwood Forest National Monument. Note the accumulation of abundant fuel around the paloverdes and saguaros.

How can I get rid of buffelgrass or fountain grass in my neighborhood?

- Pull them out! Make sure to get the whole plant or they'll come back.
- Herbicides such as Roundup can be very effective when used properly.
- Wait a few months and repeat your chosen method until no more seedlings are observed.

What are the consequences of doing nothing?

- **Profound alteration or disappearance of parts of the Sonoran Desert:**
 - Loss of biodiversity, especially "postcard" species like saguaros and paloverdes, as well as the wildlife that depend on them.
 - Increased fires, not only in natural areas but also in urban and suburban areas.

What can we do about buffelgrass and fountain grass?

- Be a good neighbor—remove them from your yard, medians and roadsides before they can spread!
- Raise awareness—talk to your friends, neighbors, and coworkers about this threat!
- Encourage state and local governments to eradicate these species on public lands, roadsides, and right-of-ways.
